Flick Workflow Guide

Turn a video, link or script into finished short-form scene animations. Source: github.com/creatorberry/flick (MIT license). Verified against the repo files on 2026-10-21.

Bottom line

- **Recommendation:** install Flick on your own Mac or PC as a Claude Code plugin, then type **/flick** in a project folder. Do not try to run it inside this cloud session. It renders video and opens a local preview window, which needs your machine.
- **What you get:** one MP4 and one poster image per scene, plus an editable plan. Best fit: S.Burley hooks and promo clips, Burley Sells Florida market updates and listing teasers, FuturEdge client reels and explainers.
- **Cost:** Flick itself is free and open source. Transcription (Whisper) runs on your computer. Your real cost is Claude usage while it plans and builds scenes, so start with a 20 to 30 second script.

1. One-time setup (about 10 minutes)

Requirements: Node.js 20 or newer, Python 3.9 or newer, internet access, and Claude Code. Flick tells you what is missing and asks before it runs any system installer.

Open Claude Code and run these two lines:

```
/plugin marketplace add Creatorberry/flick
/plugin install flick@flick
```

Then turn on auto-update so you always have the latest version: type **/plugin**, choose **Marketplaces**, select **flick**, enable auto-update. When Claude Code asks, run **/reload-plugins**.

Using Codex or another agent instead? Run: `npx skills add Creatorberry/flick --skill flick --agent codex --global --yes`, then say `Use $flick to animate this.`

First run installs Remotion, FFmpeg, Whisper, yt-dlp and the bundled sound effects into a new `flick-output/` folder. Expect a few minutes and a few hundred MB.

2. The four-step workflow

Step	What you do	What Flick does	Gate before it moves on
1. Transcript	Send a video file, a public link, or paste your script. Then answer 3 questions.	Downloads audio if it is a link, transcribes with timestamps, saves transcript.json.	transcript.json exists and all 3 answers are given.
2. Plan	Read the scene plan. Approve it or tell Flick what to change.	Writes flick-plan.md: one animation per transcript scene, with on-screen text, motion, sound effect and transition.	You approve the plan. Nothing is built before this.
3. Build	Wait.	Writes remotion-brief.md and scene-spec.json, builds one Remotion component per scene, renders each to MP4.	Every scene has a rendered preview.
4. Review and save	Watch in Remotion Studio. Request changes. Pick scenes to save for reuse.	Revises only the scene you name, makes posters, saves chosen scenes to the reusable library.	You accept the result.

3. Exactly what to type and say

Start

```
/flick
```

Flick asks: *Send a video/link to transcribe, or paste a transcript.* Paste your script or drop a file path or URL. Then it asks three questions, in this order:

Question	How to answer well
1. Aspect ratio: 9:16, 16:9, 1:1 or custom?	9:16 for Reels, TikTok and Shorts. 16:9 for YouTube and podcast promos. 1:1 for feed posts.
2. Brand assets (logo, fonts, screenshots, product images)	Copy your files into flick-output/brand-assets/ first, then say which to use. Only use assets you own or have rights to.
3. "What do you think?" Direct it like a director.	Be specific: what appears, what moves, which asset matters, moments to emphasize, the feeling, and what to avoid. Vague answers give generic scenes.

Example answer for a Burley Sells Florida clip

```
9:16.
Use brand-assets/bsf-logo.png and the two listing photos.
Open on the price counting up, then swipe through the photos.
Gold and black, confident, fast cuts. Show the key stats one
by one. No stock footage, no cartoon icons. End on the logo
and phone number held for a full second.
```

Approving the plan

Flick shows the full storyboard and asks: *Approve them, or tell me what to change.* This is your cheapest moment to fix things, so read every scene. Reply with changes by scene name, for example: `Scene 2: shorten the text to 6 words. Scene 4: remove the sound effect.`

Reviewing the build

Flick starts Remotion Studio and gives you a localhost link only after it works. Watch each scene, then say what to change. It revises and re-renders only the scene you mention. When happy, answer *Which scene animations should I save as reusable assets?* with the names you want kept.

4. What you end up with

```
flick-output/
  transcript.json         your timestamped script
  flick-plan.md           the plan you approved
  remotion-brief.md       build instructions
  scene-spec.json         scene timing and assets
  brand-assets/           your logos, fonts, images
  remotion/               editable project (Studio runs here)
  scenes/
    [scene-name]/
      [scene-name].mp4    the finished clip
      poster.jpg          thumbnail image
```

If flick-output already exists, Flick makes a new dated folder instead of overwriting. Your earlier work is safe.

5. Rules Flick follows (so nothing surprises you)

- Your transcript sets the timing of every scene. Flick will not stretch or cut it unless you ask.
- No background music. Sound effects are used only when they match a visible action (typing, click, impact, reveal, transition).
- Text stays on screen long enough to read, about 0.3 seconds per word with a 1.2 second minimum.
- Each scene is its own named animation. A change to one scene never touches the others.
- It should not claim a render or preview exists unless the command actually succeeded.

6. Ready-made scene styles you can ask for

Flick ships 14 reusable templates and reuses one only when it clearly fits. You can steer toward them by name in your answer to question 3.

Template	Good for
token-waste-terminal, pdf-token-limit	AI cost or limit hooks, tech explainers (FuturEdge content)
connected-workflow-terminals, agent-role-showcase	Showing a process or a team of specialist steps (AI automation offers)
tool-constellation-merge	Several tools combining into one product
page-card-to-header-zoom, page-scroll-and-title-focus, fast-page-scroll	Website or listing page reveals with a screenshot
content-carousel	Showing multiple post designs or listing photos in sequence
website-resource-reveal, source-to-authority-to-install	Introducing a tool, resource or guide
video-to-frames, two-tools-to-video-frames	Video analysis and frame extraction demos

Templates keep the structure but not the original private imagery. You supply your own screenshots and logos.

7. Risks and things to verify before you publish

Risk	What to do
Remotion license. Flick builds on Remotion. Remotion is free for individuals and very small teams, but larger for-profit companies need a paid license. I have not verified the current terms.	Check remotion.pro/license before using Flick for paid client work at FuturEdge. Treat as unconfirmed until you do.
Source rights. Flick will animate any link or video you give it, including other creators' content.	Only use footage, audio, images and fonts you own or have licensed. Your own voice, listings and brand are the safe default.
Real estate compliance. Listing clips with prices, stats or claims.	Verify every number against the MLS. Add the brokerage name (Century 21 BE3) and any required advertising disclosures. Confirm with your brokerage rules, not this guide.

Risk	What to do
Claude usage cost. Planning and building many scenes uses real tokens. This is an estimate, not a measured number.	Start with one 20 to 30 second script. Use a lighter model for revisions. Check usage after the first run before batching.
Promo links. The skill adds links to Creatorberry, a paid service by the same author.	Optional. Ignore them unless you want that service.
Third-party code. Flick installs packages and runs scripts on your machine.	It is open source and I read its setup files, which install Remotion, FFmpeg, Whisper and yt-dlp. Still, run it in a dedicated project folder, not your main one.

8. Troubleshooting

Problem	Fix
Node or Python not found	Install Node.js 20+ and Python 3.9+, restart Claude Code, run /flick again. Flick prints the install command for your system.
Studio link will not open	Flick only shares it after Studio starts. If it fails, ask Flick to restart Studio from flick-output/remotion/ with: npm run studio
Plugin not found	Re-run the two /plugin commands, then /reload-plugins.
Scenes look generic	Your answer to question 3 was too vague. Ask Flick to revise the plan with specific on-screen actions and assets.
Text flashes too fast	Ask to reduce the words in that scene or split it into two. Flick should not speed up readable text.
Link will not download	Use a public link. For private or login-only video, download the file yourself and send the file path.

9. Your first run: 30-minute checklist

- Install Node.js 20+ and Python 3.9+ if you do not have them.
- Make a new empty folder called flick-test and open Claude Code in it.
- Run the two /plugin install commands, then /reload-plugins.
- Put your logo in a folder named flick-output/brand-assets/.
- Write a 25 second script for one S.Burley hook or one Burley Sells Florida market tip.
- Run /flick, paste the script, answer the 3 questions, approve the plan.
- Review in Studio, request one change, accept, and save the scene you like most.
- Note how long it took and how much Claude usage it used, then decide whether to batch more.

Next three actions

- Confirm Remotion license terms for commercial FuturEdge client work.
- Run the 30-minute test with one 25 second script and your own assets.
- If the output is strong, build a repeatable weekly batch: 3 hooks for S.Burley, 1 market update for Burley Sells Florida.
